

## LR Tank skid Installation Instructions

Please read through all instructions before you begin.

The LR gas tank skid utilizes the stock gas tank mounting points.

There are two bolts at the front of the tank close together. Loosen these two bolts so about one half inch of thread is showing on each bolt.

Next, look at the Tactical 4x4 tank skid and match up the two rear mount points with the two rear bolts on the vehicle. Remove these two bolts. It will be the very rear bolt and a side bolt to the frame.

On occasion there can be two washers on these bolts. If so remove one so there is only one washer per bolt. The threads won't reach with two.

Slide the plate onto the two front bolts utilizing the slots at the front of the plate.

Lift the rear of the plate up into position and brace it in place so you don't have to hold it. A floor jack works well for this.

Replace the two rear bolts through the slider and into their original position.

It can be tricky to get them to line up and catch, but they will go.

Once all the bolts are started, tighten down all four bolts.

We recommend using loc-tite on the two rear bolts.

Order of installation:

Sliders, Trans skid, Tank skid.
